# GRAPHS WITH NON-ISOMORPHIC VERTEX NEIGHBOURHOODS OF THE FIRST AND SECOND TYPES 

Zdeněk Ryjáček, Plzeñ

(Received August 8, 1985)

#### Abstract

Summary. The paper is devoted to the relation between the classes $\mathbb{E}_{1}, \mathfrak{G}_{2}$ of graphs with non-isomorphic vertex neighbourhoods of the first and second types; the main theorem of the paper implies that each of the classes $\mathfrak{G}_{1}-\mathfrak{E}_{2}, \mathfrak{G}_{2}-\mathfrak{G}_{1}, \mathfrak{G}_{1} \cap \mathfrak{G}_{2}$ is infinite.

Keywords: Neighbourhood of a vertex, local properties of graphs, asymmetrical graphs.
AMS Classification: 05C99.

## INTRODUCTION

Let $G=(V(G), E(G))$ be a finite undirected graph without loops and multiple edges, $u \in V(G)$ its vertex. The neighbourhood of $u$ (defined in the obvious sense, i.e., as the induced subgraph on the set of all vertices which are adjacent to $u$ in $G$ ) will be referred to as the neighbourhood of the first type of $u$ and denoted by $N_{1}(u, G)$. We say that an edge $v w \in E(G)$ is adjacent to $u$ if $v \neq u \neq w$ and either $v$ or $w$ is adjacent to $u$. According to [3], [5], [2] we define the "line-version" of $N_{1}(u, G)$ as follows: The neighbourhood of the second type of $u$ (denoted by $N_{2}(u, G)$ ) is the edge-induced subgraph (see e.g. [1], [6]) on the set of all edges which are adjacent to $u$. (More precisely: the edge set of $N_{2}(u, G)$ contains all the edges $v w \in E(G)$ for which $\min \{\varrho(v, u), \varrho(w, u)\}=1, \varrho(x, y)$ denoting the distance of vertices $x, y)$.
J. Sedláček [3], [5] introduced the following classes $\boldsymbol{G}_{1}, \mathfrak{F}_{2}$ of asymmetrical graphs: $\mathscr{G}_{\boldsymbol{i}}$ contains all graphs $G$ such that for every pair of distinct vertices $u, v \in V(G)$ the neighbourhoods of the $i$-th type $N_{i}(u, G), N_{i}(v, G)$ are non-isomorphic, $i=1,2$.

In [3] it is shown that for every integer $n \geqq 6$ there exists a graph $G_{n} \in \mathfrak{G}_{1}$ with $n$ vertices; the corresponding graph $G_{6}$ (with the minimum number of vertices) is shown in Fig. 1. The analogous question for the class $\mathscr{G}_{2}$ is solved in [2]: A graph $G_{n} \in \mathscr{G}_{2}$ with $n$ vetices exists if and only if $n \geqq 7$; the corresponding minimal graph $G_{7}$ with 7 vertices is shown in Fig. 2.

As shown in [5], the graph in Fig. 1 belongs, in fact, to $\mathscr{G}_{1}-\mathfrak{G}_{2}$, and hence $\mathfrak{G}_{1}-\mathfrak{G}_{2} \neq \emptyset$; analogously, the graph in Fig. 2 belongs to $\mathfrak{G}_{2}-\mathfrak{G}_{1}$, and hence
$\mathfrak{G}_{2}-\mathfrak{G}_{1} \neq \emptyset$. Further, an example is given in [5] of a graph with 8 vertices which belongs to $\mathfrak{G}_{1} \cap \mathfrak{G}_{2}$; hence $\mathfrak{G}_{1} \cap \mathfrak{G}_{\mathbf{2}} \neq \emptyset$. In the present paper we shall show that each of the classes $\mathfrak{G}_{1}-\mathfrak{G}_{2}, \mathfrak{G}_{2}-\mathfrak{G}_{1}, \mathfrak{G}_{1} \cap \mathfrak{G}_{2}$ is infinite, and we shall find the minimal member in the last of them.

## MAIN THEOREM

Theorem. Let $n$ be an integer. Then there exists a graph $G_{n}$ with $n$ vertices which belongs to the class
a) $\mathfrak{G}_{1}-\mathfrak{G}_{2}$ if and only if $n \geqq 6$,
b) $\mathfrak{G}_{2}-\mathfrak{G}_{1}$ if and only if $n \geqq 7$,
c) $\mathfrak{G}_{1} \cap \mathfrak{G}_{2}$ if and only if $n \geqq 7$.

Corollary. Each of the classes $\mathfrak{G}_{1}-\mathfrak{G}_{2}, \mathfrak{G}_{2}-\mathfrak{G}_{1}, \mathfrak{G}_{1} \cap \mathfrak{G}_{2}$ is infinite.
We shall first prove some auxiliary assertions. We say that a vertex $u \in V(G)$ is universal if it is adjacent to all the other vertices of $G$.

Lemma 1. Let $n \geqq 6$ be an integer; suppose that $G_{n}$ is a connected graph having $n$ vertices $u_{1}, \ldots, u_{n}$, and that none of them is universal. Let us construct the graph $G_{n+1}$ with $n+1$ vertices by adding a new vertex $u_{n+1}$ to $G_{n}$ and making it universal in $G_{n+1}$. Then
a) $G_{n} \in \mathfrak{G}_{1} \Leftrightarrow G_{n+1} \in \mathfrak{G}_{1}$,
b) $\boldsymbol{G}_{n} \in \mathfrak{G}_{2} \Leftrightarrow \boldsymbol{G}_{n+1} \in \mathfrak{G}_{2}$.

Proof. 1. Let $i=1$ or $i=2$ and $G_{n} \in \mathscr{G}_{i}$; suppose $G_{n+1} \notin \mathscr{G}_{i}$, i.e., for some distinct vertices $u_{\alpha}, u_{\beta} \in V\left(G_{n+1}\right)$ there exists an isomorphism $f: N_{i}\left(u_{\alpha}, G_{n+1}\right) \rightarrow N_{i}\left(u_{\beta}, G_{n+1}\right)$. Since $u_{n+1}$ is universal in $N_{i}\left(u_{j}, G_{n+1}\right)$ for $1 \leqq j \leqq n$ while $N_{i}\left(u_{n+1}, G_{n+1}\right) \simeq G_{n}$ has no universal vertex, necessarily $\alpha \leqq n$ and $\beta \leqq n$ ( $\simeq$ denotes isomorphism).

Hence either $f\left(u_{n+1}\right)=u_{n+1}$ and then the partial mapping $\left.f\right|_{V\left(N_{i}\left(u_{\alpha}, G_{n}\right)\right)}$ is an isomorphism $N_{i}\left(u_{\alpha}, G_{n}\right)$ onto $N_{i}\left(u_{\beta}, G_{n}\right)$, which is impossible, or $f\left(u_{n+1}\right)$ is another universal vertex $u_{y}$ in $N_{i}\left(u_{\beta}, G_{n+1}\right)$, and in this case interchanging the universal vertices $u_{\gamma}, u_{n+1}$ we again obtain a contradiction.
2. If, conversely, $G_{n} \notin \mathfrak{G}_{i}$ for $i=1$ or $i=2$, then we have an isomorphism $f: N_{i}\left(u_{\alpha}, G_{n}\right) \rightarrow N_{i}\left(u_{\beta}, G_{n}\right)$; defining $f\left(u_{n+1}\right)=u_{n+1}$ we obtain an isomorphism $f: N_{i}\left(u_{\alpha}, G_{n+1}\right) \rightarrow N_{i}\left(u_{\beta}, G_{n+1}\right)$ and hence $G_{n+1} \notin \mathfrak{G}_{i}$.

Lemma 2. Let $n \geqq 6$ be an integer; suppose that $G_{n}$ is a graph with $n$ vertices $u_{1}, \ldots, u_{n}$ such that the only universal vertex in $G_{n}$ is $u_{n}$ and that the minimum degree of $G_{n}$ is at least 2 . Let us construct the graph $G_{n+1}$ with $n+1$ vertices by adding a new vertex $u_{n+1}$ to $G_{n}$ and joining it to $u_{n}$ by an edge. Then
a) $G_{n} \in \mathfrak{F}_{1} \Leftrightarrow G_{n+1} \in \mathfrak{F}_{1}$,
b) $G_{n} \in \mathfrak{G}_{2} \Leftrightarrow G_{n+1} \in \mathfrak{G}_{2}$.

Proof. a) 1. Let $G_{n} \in \mathfrak{G}_{1}$. Evidently $N_{1}\left(u_{i}, G_{n}\right)=N_{1}\left(u_{i}, G_{n+1}\right)$ for $1 \leqq i \leqq n-1$; moreover, $u_{n}$ is the only vertex of degree $n$ in $G_{n+1}$ and $u_{n+1}$ is the only vertex of degree 1 in $G_{n+1}$. Hence $G_{n+1} \in \mathscr{G}_{1}$.
2. Suppose conversely that $G_{n} \notin \mathfrak{F}_{1}$, i.e., some distinct vertices $u_{\alpha}, u_{\beta} \in V\left(G_{n}\right)$ have isomorphic neighbourhoods. Since $u_{n}$ is the only universal vertex in $G_{n}$, necessarily $\alpha \neq n \neq \beta$; hence

$$
N_{1}\left(u_{\alpha}, G_{n+1}\right)=N_{1}\left(u_{\alpha}, G_{n}\right) \simeq N_{1}\left(u_{\beta}, G_{n}\right)=N_{1}\left(u_{\beta}, G_{n+1}\right)
$$

and therefore $G_{n+1} \notin \mathfrak{G}_{1}$.
b) 1. Let $G_{n} \in \mathfrak{G}_{2}$ and suppose that $G_{n+1} \notin \mathfrak{G}_{2}$, i.e., there exists an isomorphism $f: N_{2}\left(u_{\alpha}, G_{n+1}\right) \rightarrow N_{2}\left(u_{\beta}, G_{n+1}\right)$ for some $u_{\alpha}, u_{\beta} \in V\left(G_{n+1}\right), u_{\alpha} \neq u_{\beta}$. First observe that the neighbourhoods of $u_{i}$ for $i \neq n$ have $n$ vertices while $N_{2}\left(u_{n}, G_{n+1}\right)$ has $n-1$ vertices; hence $\alpha \neq n \neq \beta$. Further, evidently $N_{2}\left(u_{n+1}, G_{n+1}\right) \simeq K_{1, n-1}$. If $\alpha=$ $=n+1$ then $N_{2}\left(u_{\beta}, G_{n+1}\right) \simeq K_{1, n-1}$ and $1 \leqq \beta \leqq n-1$; considering neighbourhoods of the neighbouring vertices of $u_{\beta}$ we obtain a contradiction. Hence $\alpha \neq n+1$; similarly $\beta \neq n+1$ and therefore $1 \leqq \alpha, \beta \leqq n-1$. The vertex $u_{n+1}$ has degree 1 both in $N_{2}\left(u_{\alpha}, G_{n+1}\right)$ and in $N_{2}\left(u_{\beta}, G_{n+1}\right)$; hence either $f\left(u_{n+1}\right)=u_{n+1}$ and then the partial mapping $\left.f\right|_{V\left(N_{2}\left(u_{\alpha}, G_{n}\right)\right)}$ is an isomorphism $N_{2}\left(u_{a}, G_{n}\right)$ onto $N_{2}\left(u_{\beta}, G_{n}\right)$, which is impossible, or $f\left(u_{n+1}\right)$ is another vertex $u_{\gamma}$ of degree 1 in $N_{2}\left(u_{\beta}, G_{n}\right)$ and in this case by interchanging the vertices $u_{n+1}, u_{\gamma}$ we again obtain a contradiction.
2. Suppose conversely that $G_{n} \notin \mathfrak{G}_{2}$, i.e., we have an isomorphism $f: N_{2}\left(u_{\alpha}, G_{n}\right) \rightarrow$ $\rightarrow N_{2}\left(u_{\beta}, G_{n}\right)$ for some $u_{\alpha}, u_{\beta} \in V\left(G_{n}\right), \alpha \neq \beta$. Necessarily $\alpha \neq n \neq \beta$ since $u_{n}$ is universal in $N_{2}\left(u_{i}, G_{n}\right)$ for $1 \leqq i \leqq n-1$ while $N_{2}\left(u_{n}, G_{n}\right)$ has no universal vertex. Further, $u_{n}$ is the only vertex of degree $n-1$ both in $N_{2}\left(u_{\alpha}, G_{n}\right)$ and in $N_{2}\left(u_{\beta}, G_{n}\right)$, and hence $f\left(u_{n}\right)=u_{n}$. Therefore, if we define $f\left(u_{n+1}\right)=u_{n+1}$, we obtain an isomorphism $N_{2}\left(u_{\alpha}, G_{n+1}\right)$ onto $N_{2}\left(u_{\beta}, G_{n+1}\right)$, i.e. $G_{n+1} \notin G_{2}$.

Lemma 3. Let $n \geqq 6$ be an integer; suppose that $G_{n}$ is a graph with $n$ vertices $u_{1}, \ldots, u_{n}$ such that the only universal vertex in $G_{n}$ is $u_{n-1}$ and the only vertex of degree 1 in $G_{n}$ is $u_{n}$. Let us construct the graph $G_{n+1}$ with $n+1$ vertices by adding a new vertex $u_{n+1}$ to $G_{n}$ and joining it to $u_{n}$ by an edge. Then
a) $G_{n} \in \mathfrak{G}_{1} \Leftrightarrow G_{n+1} \in \mathfrak{G}_{1}$,
b) $\boldsymbol{G}_{n} \in \mathfrak{G}_{2} \Leftrightarrow G_{n+1} \in \mathfrak{G}_{2}$.

Proof. a) 1. If $G_{n} \in \mathfrak{F}_{1}$, then, since $N_{1}\left(u_{i}, G_{n}\right)=N_{1}\left(u_{i}, G_{n+1}\right)$ for $1 \leqq i \leqq n-1$, $N_{1}\left(u_{n+1}, G_{n+1}\right)$ is the graph which consists of an isolated vertex and $N_{1}\left(u_{n}, G_{n+1}\right)$ consists of two isolated vertices, evidently $G_{n+1} \in \mathfrak{G}_{1}$.
2. If, conversely, $G_{n} \notin \mathfrak{G}_{1}$, then there exist vertices $u_{\alpha}, u_{\beta}, \alpha \neq \beta$, such that $N_{1}\left(u_{\alpha}, G_{n}\right) \simeq N_{1}\left(u_{\beta}, G_{n}\right)$. Evidently $1 \leqq \alpha, \beta \leqq n-1$ and hence $N_{1}\left(u_{\alpha}, G_{n+1}\right)=$ $=N_{1}\left(u_{\alpha}, G_{n}\right) \simeq N_{1}\left(u_{\beta}, G_{n}\right)=N_{1}\left(u_{\beta}, G_{n+1}\right)$, i.e. $G_{n+1} \notin \mathfrak{G}_{1}$.
b) 1. If $G_{n} \in \mathfrak{G}_{2}$, then evidently $G_{n+1} \in \mathfrak{G}_{2}$, since $N_{2}\left(u_{i}, G_{n+1}\right)=N_{2}\left(u_{i}, G_{n}\right)$ for $1 \leqq i \leqq n, i \neq n-1$, and these neighbourhoods have $n-1$ vertices and are connected, while $N_{2}\left(u_{n-1}, G_{n+1}\right)$ is disconnected and $N_{2}\left(u_{n+1}, G_{n+1}\right)$ has exactly two vertices.
2. If, conversely, $G_{n} \notin \mathfrak{G}_{2}$, then $N_{2}\left(u_{\alpha}, G_{n}\right) \simeq N_{2}\left(u_{\beta}, G_{n}\right)$ for some $\alpha \neq \beta$. One can easily observe that necessarily $\alpha \neq n-1 \neq \beta$ and hence evidently $\boldsymbol{G}_{n+1} \notin \mathscr{G}_{2}$.

Proof of the theorem. The assertion concerning the non-existence of the graph $G_{n} \in \mathfrak{G}_{1}-\mathfrak{G}_{2}$ with $n$ vertices for $n \leqq 5$ is contained in [3], the non-existence of the graph $G_{n}$ on $n$ vertices which belongs either to $\mathfrak{G}_{2}-\mathfrak{G}_{1}$ or to $\mathfrak{G}_{1} \cap \mathfrak{G}_{2}$ follows for $n \leqq 6$ from [2], Theorem 2.1.
a) For $n \geqq 6$ define the graph $G_{n} \in \mathfrak{G}_{1}-\mathfrak{F}_{2}$ by using the following construction:

- for $n=6$ see the graph $G_{6}$ in Fig. 1;
- having obtained $G_{n}$, construct $G_{n+1}$ using Lemma 1 for $n \equiv 0(\bmod 3)$, Lemma 2 for $n \equiv 1(\bmod 3)$, Lemma 3 for $n \equiv 2(\bmod 3)$.
b) For $n \geqq 7$ define the graph $G_{n} \in \mathfrak{F}_{2}-\mathfrak{G}_{1}$ by using the following construction:
- for $n=7$ see the graph $G_{7}$ in Fig. 2;
- having obtained $G_{n}$, construct $G_{n+1}$ using

Lemma 1 for $n \equiv 1(\bmod 3)$,
Lemma 2 for $n \equiv 2(\bmod 3)$,
Lemma 3 for $n \equiv 0(\bmod 3)$.
c) For $n \geqq 7$ define the graph $G_{n} \in \mathfrak{G}_{1} \cap \mathfrak{G}_{2}$ by using the following construction:

- for $n=7$ see the graph $G_{7}$ in Fig. 3; one can easily observe that $G_{7} \in \mathfrak{G}_{1} \cap \mathfrak{G}_{2}$;
- having obtained $G_{n}$, construct $G_{n+1}$ using

Lemma 1 for $n \equiv 1(\bmod 3)$,
Lemma 2 for $n \equiv 2(\bmod 3)$,
Lemma 3 for $n \equiv 0(\bmod 3)$.
